

Generally Arduino Code have 3 part:-

- 1) Define the variables

- 2) $\text{setup}(\{ \})$

↳ which variable input or output

which pin have to use

`pinMode ( pin no. , (mode) );`

↓
INPUT / OUTPUT

- 3) loop () { }

```
digitalWrite (pin no. , High/Low);  
delay ();
```

Arduino Trifecta

* Hardware

* IDE

* Code

↳ Sketch

(C/C++)

① Digital pins → Can act both Input or output

② Analog

- * How every Arduino program is laid out.
 - * How to use Variable.
 - * How to use Control Structures if, else if
 - * The MOST important Arduino Specific function.
-

How every Arduino program is laid out.

Variables :-

to store Information

type

type name;

Name

type name = Value;

" = "

Value

Functions :-

* Pin Mode (pin no. , INPUT/OUTPUT);

* analogWrite (pin no. , Some value);

* delay (time);
 ↗ milisecond

* Serial.begin (9600); // Baud Rate
library

* analogRead (); → Reads the Analog pins
(A0 - A5)

* map (Value , Current Range , Desired Range);
↘ Convert one range to another Range

* Serial.print (value); To see value at
Serial Monitor

* digitalRead (pin no.); // Read the voltage at
the pin

* digitalWrite (pin no. , HIGH/LOW);
